QUEUE

STACK

# What is Linear Data Structure

- In linear data structure, data is arranged in linear sequence.
- Data items can be traversed in a single run.
- In linear data structure elements are accessed or placed in contiguous(together in sequence) memory location.

# WHAT Is *stack*

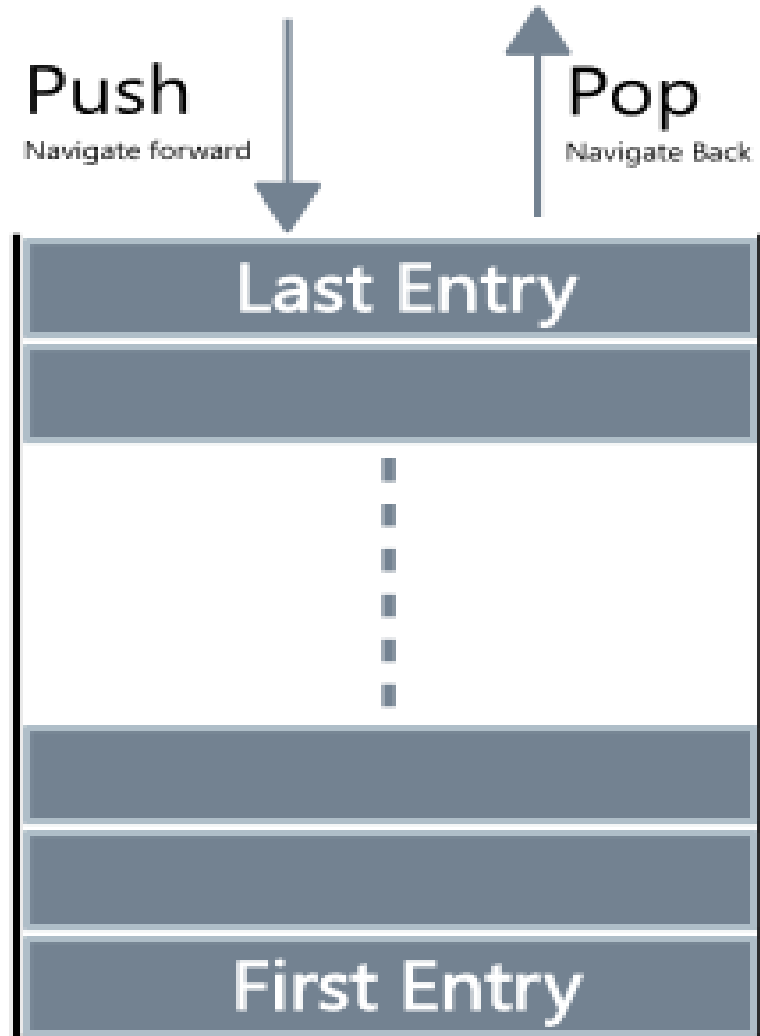

- A stack is called a last-in-first-out (LIFO) collection. This means that the last thing we added (pushed) is the first thing that gets pulled (popped) off.
- A stack is a sequence of items that are accessible at only one end of the sequence.

# EXAMPLES OF STACK:

# Operations that can be performed on STACK:

- PUSH.
- POP.

PUSH : It is used to insert items into the stack.

POP: It is used to delete items from stack.

TOP: It represents the current location of data in stack.

# ALGORITHM OF INSERTION IN STACK: (PUSH)

1. Insertion(a,top,item,max)
2. If top=max then  
print 'STACK OVERFLOW'  
exit  
else
3. top=top+1  
end if
4. a[top]=item
5. Exit

# ALGORITHM OF DELETION IN STACK: (POP)

1. Deletion(a,top,item)
2. If  $\text{top}=0$  then  
    print 'STACK UNDERFLOW'  
    exit  
    else
3.  $\text{item}=\text{a}[\text{top}]$   
    end if
4.  $\text{top}=\text{top}-1$
5. Exit

THANK YOU 😊
